## Contents

<b>Introduction</b>	<b>ix</b>
<b>1. Methods of producing laser projection images</b>	<b>1</b>
1.1. Development of laser television display devices	1
1.2. Pulsed method of forming a television image	15
1.3. Pulsed lasers for the television image forming system	17
1.3.1. <i>Gas lasers</i>	17
1.3.2. <i>Solid-state lasers</i>	21
<b>2. Acousto-optical devices for modulation and deflection of the laser light beam for information display systems</b>	<b>24</b>
2.1. Comparison of light scattering in optically isotropic and anisotropic media	24
2.2. Geometry of scattering for various crystallographic planes in uniaxial crystals	27
2.2.1. <i>Anisotropic diffraction in the case of an arbitrary scattering geometry</i>	33
2.3. Acousto-optical devices and their manufacturing technology	35
2.3.1. <i>Piezotransducer for acousto-optical device</i>	38
2.3.2. <i>Coefficient of electromechanical coupling</i>	40
2.3.3. <i>Attaching a piezoelectric transducer to a crystalline element</i>	43
2.3.4. <i>Cleaning of the surfaces of the piezotransducer and sound pipe before the deposition of binding metals</i>	46
2.3.5. <i>Grinding of the piezotransducer after welding to a specified thickness</i>	47
2.3.6. <i>Orientation and manufacture of acousto-optical cell sound transmission</i>	49
2.3.7. <i>Attachment of the absorber-heat sink</i>	52
2.3.8. <i>Sputtering of the upper electrode</i>	54
2.4. Acousto-optical modulator for a pulsed television image formation system	54

2.5.	Devices for the scanning of the light beam	60
2.6.	Variants of construction of an optical system for an acousto-optical device for the formation of a television image with a pulsed laser	65
<b>3.</b>	<b>Theoretical consideration of the process of image formation in the acousto-optical system with the pulsed coherent light source</b>	<b>68</b>
3.1.	Diffraction of a plane light wave by ultrasound in a gyrotropic $\text{TeO}_2$ crystal	68
3.1.1.	<i>Statement of the problem and derivation of the integral equation for the field</i>	69
3.1.2.	<i>Solution of the integral equation</i>	76
3.1.3.	<i>Anisotropic diffraction of light by a slow shear wave in a <math>\text{TeO}_2</math> crystal at a constant amplitude of an ultrasonic perturbation</i>	79
3.1.4.	<i>Anisotropic diffraction with amplitude modulation of the ultrasonic signal</i>	88
3.2.	Forming a line image in an acousto-optical system with a pulsed coherent light source	92
3.3.	Frequency-contrast characteristic and the limiting number of solvable system elements per frame	102
3.3.1.	<i>The case of low efficiency of the acousto-optical interaction</i>	102
3.3.2.	<i>Influence of the nonlinearity of the acousto-optical interaction on the quality of the image being formed. Approximation of the third order of interaction. Limits of applicability of the first order of interaction</i>	109
3.3.3.	<i>Approximation of the fifth order of interaction. Limits of the applicability of the third-order approximation of the interaction</i>	117
<b>4.</b>	<b>Development and experimental investigations of individual sections and elements of acousto-optical system for the formation of TV images</b>	<b>126</b>
4.1.	Optimization of the parameters of the copper vapour laser radiation applied to the projection information display system	126
4.1.1.	<i>A copper vapour laser with intracavity acousto-optical control of its spectral and temporal characteristics</i>	136
4.1.2.	<i>Control of the parameters of the light beam in</i>	

	<i>the oscillator–amplifier of laser radiation system</i>	141
4.1.3.	<i>A system of two lasers on copper vapour with the Injection of a light beam into a powerful laser</i>	143
4.2.	<i>Production of a blue line in a titanium–sapphire laser with pumping from a copper vapour laser and transformation of radiation into a second harmonic</i>	146
4.3.	The design of acousto-optical modulators and deflectors for a pulse information display system	152
4.4.	Features of the operation of electronic control devices for the acousto-optical television information display system	163
4.5.	Optimization of the optical scheme for the information display system with a pulsed copper vapour laser	172
5.	<b>Experimental investigations of the acousto-optical system or displaying and recording information with a copper vapour laser</b>	<b>178</b>
5.1.	Study of amplitude transfer characteristics and non-linear distortions in the formation of the image of a line	178
5.2.	Experimental study of the characteristics of the acousto-optical television information display system on the projection screen	184
5.2.1.	<i>Optical scheme of the installation</i>	185
5.2.2.	<i>Experimental results</i>	188
5.2.3.	<i>On the possibility of creating a multicolour projection device with metal vapour lasers</i>	193
5.3.	Application of an acousto-optical system with a pulsed copper vapour laser to record information	194
5.3.1.	<i>Recording of information on the space–time light modulator PRIZ</i>	194
5.3.2.	Recording television information on film	199
5.3.3.	Recording television information on other carriers	199
5.4.	Displaying TV information on the big screen	200
5.5.	Prospects for creating an acousto-optical system for displaying TV information in the high-definition standard with pulsed lasers	206
5.5.1.	<i>Study of the operation of the acousto-optical television information display system in the standard of enhanced definition</i>	206

5.5.2. Variants of creating a colour acousto-optical system with pulsed lasers operating in the HDTV standard	210
<b>Conclusion</b>	<b>215</b>
<b>Appendix 1. Parameters of some crystals used in acousto-optical devices</b>	<b>216</b>
<b>Appendix 2. Expressions for the time-average light intensity in the fifth and fourth order of interaction</b>	<b>227</b>
<b>Appendix 3. Design of the copper vapour laser (laser generator) developed for the display of information of a large screen</b>	<b>232</b>
<b>Appendix 4. An oscillator–amplifier copper vapour laser system for illumination of architectural structures and formation of vector–graphic images</b>	<b>241</b>
<b>References</b>	<b>252</b>
<b>Index</b>	<b>260</b>

# Introduction

The creation of devices capable of displaying a large amount of information with high quality of the reproduced image is of practical interest in such areas of science and technology as optical processing of information, recording information on various types of media, the reproduction of television images, communication and others where we are dealing with large flows information in real time.

At present, great efforts of the leading electronic companies of the world are aimed at creating television systems for displaying information using laser light sources. Lasers provide high brightness and color contrast in the image, unattainable for lamps and phosphors. Among the laser sources, pulsed lasers are emitted, which allow the effective nonlinear conversion of radiation to other parts of the visible spectrum and, thus, cover the entire wavelength range available for visual perception. One of the promising methods of real-time imaging for these lasers is the pulse image projection method of an amplitude-modulated ultrasonic line that fills the aperture of the acousto-optical modulator.

In the modulation method under consideration, there is no high-speed scan in a row, and, unlike existing methods that use matrix modulators, there is no discrete structure in the image. It is formed in real time without delay and is better consistent with a consistent way of transmitting information over the communication channel. Image dimensions can easily be transformed without modifying the modulation devices themselves. When recording information on various types of media, it is possible to perform coherent optical processing of this information. The possibility of using fully acousto-optical control devices for the system under consideration makes it possible to reject for a number of problems such mechanical control devices as mirror scanners, polyhedral rotating prisms, matrices, and micromirror lines. In addition, crystal media used for modulators can withstand large average and pulsed laser radiation powers, which

makes it possible to use the systems in question for technological purposes.

Despite the fact that the impulse imaging method has been known for a long time, there are many unresolved issues related to the efficiency and quality of image formation with the most effective acousto-optical modulators (AOM) on a paratellurite ( $\text{TeO}_2$ ) crystal with amplitude modulation of ultrasound. The complexity of the problem lies in the fact that acousto-optical diffraction must be considered for an anisotropic gyrotropic medium, which is a  $\text{TeO}_2$  crystal, and for an intermediate mode of diffraction of light by sound. The question of the prospects of practical application of this method for displaying full-colour television information on large screens in the high-definition standard is unclear.

Of great importance is the question of optimizing the output parameters of the laser for the purpose of imaging by the pulsed method. A copper vapour laser can be chosen as such a source, which remains one of the most powerful sources of light in the visible region of the spectrum and, in its output characteristics, agrees quite well with the requirements for a pulsed imaging system. In Russia, work is continuing to improve these lasers in the direction of increasing pump efficiency and practical efficiency.

The aim of the authors' research is the development of the theory of acousto-optical interaction for anisotropic crystalline media possessing gyrotropic properties and on its basis the development of a technique for calculating the spatial distribution of the intensity of light radiation on the projection screen during the diffraction of pulsed laser radiation by an amplitude modulated ultrasonic signal in a paratellurite crystal ( $\text{TeO}_2$ ).

The study of the characteristics of an acousto-optical system with a pulsed method of forming a line for displaying and recording information using copper vapor lasers makes it possible to extend the results obtained by the authors to systems using full-colour pulsed solid-state lasers, which are now rapidly developing.
